l Examples: Logic Chains

em accounts into policy-relevant values

bon Sequestration (Mangroves)

1	2	3	4	5
Mangrove extent	NCP rate	Physical supply	Social cost of carbon	Monetary value
350 ha	3.7 Mg CO2/ha/yr	1,295 Mg CO2/yr	$51 / tCO2	$66,045 / yr

350 ha x 3.7 Mg CO2/ha/yr = 1,295 Mg CO2/yr x $51/tCO2 = $66,045/yr

ı Provisioning (Reef Fisheries)

1	2	3	4	5
Annual catch	Market price	Gross revenue	Minus costs	Resource rent
180,000 kg	$3.50 / kg	$630,000	- $420,000	$210,000 / yr

180,000 kg x $3.50/kg = $630,000 - $420,000 costs = $210,000/yr resource rent

em accounts into policy-relevant values

stal Protection (Coral Reefs)

1. Reef extent along coast — **12 km**
2. Assets behind reef — **Infrastructure at risk**
3. Replacement cost — **$5,000 / m**
4. Total replacement — **$60,000,000**
5. Annualized value — **$1,200,000 / yr**

12 km x 1,000 m/km x $5,000/m = $60M total, annualized at 2% = $1.2M/yr

ıods connect

e 1)

ınt (area) multiplied by literature rate, then valued of Carbon. Most accessible method -- needs only ublished NCP rate.

Fish (Example 2)

Uses **catch statistics** and market data. Valued via resource rent (revenue minus intermediate costs). Requires economic data on fishing costs.

Coastal Protection (Example 3)

Uses **extent account** (reef length) and replacement cost of built infrastructure. Annualized to produce annual service flow.

d Examples: Logic Chains

m services for one accounting area

nbined Services -- Single Accounting Area

Service	Ecosystem	Method	Physical Supply	Monetary Value ($/yr)
ɔning	Coral reef	Resource rent	180,000 kg/yr	$210,000
uestration	Mangrove + seagrass	Social cost of carbon	2,334 Mg CO2/yr	$119,085
' tourism	Coral reef + beach	Direct expenditure	25,500 visits/yr	$1,275,000
ection	Coral reef	Replacement cost	12 km reef frontage	$1,200,000
NUAL ECOSYSTEM SERVICE VALUE				**$2,804,085**

ALUE

Recreation Coastal protection

ulating and cultural services dominate

and coastal protection (43%) together account for 89% of the total annual value. These non-market services are invisible without ocean accounts. Provisioning (fish) contributes only et it typically receives the most policy attention. Ocean accounts reveal the hidden economic importance of reef and mangrove conservation for tourism revenue and disaster risk erful argument for Marine Spatial Planning and blue finance.
