OESA vs SEEA-EA: Two Sides of Ocean Accounts

Complementary frameworks for understanding the ocean economy and ocean ecosystems

Ocean Economy (OESA)

BASED ON	**System of National Accounts** (SNA)
MEASURES	Market-based economic activity
KEY INDICATOR	**Gross Value Added** (GVA), GDP contribution
SECTORS	Fisheries, minerals, transport, tourism, construction, ship building
DATA FROM	National statistical offices, Supply-Use Tables
OUTPUT	**Ocean GDP** as % of national GDP

"How big is the ocean economy?"

Ecosystem Accounts (SEEA-EA)

BASED ON	**System of Environmental-Economic Accounting**
MEASURES	Ecosystem health and non-market values
KEY INDICATOR	**Condition Index** (0–1), ecosystem service values
ACCOUNTS	Extent, Condition, Ecosystem Services
DATA FROM	Remote sensing, field surveys, ecological monitoring
OUTPUT	**Condition trends**, service valuations

"How healthy is the ocean and what does it provide?"

✱ **Together they give the full picture:** OESA shows what the ocean contributes to the economy. SEEA-EA shows what the economy depends on from the ocean. One without the other is incomplete.

⚗ **OESA**

→ Fisheries GVA depends on fish stock condition

→ Tourism GVA depends on reef & water quality

→ Economic pressures affect ecosystem condition

☘ **SEEA-EA**
